★★★★★

Challenge Description

A group or network of machines that are controlled by an attacker to do a certain task

Answer

Answer

Author: The Analyst: Hyposelenia

Challenge: Robot

Category: General information

Date: 04/10/26

I. Objective

To determine the correct term describing a machine or automated program controlled to perform tasks, often under the direction of an external entity.

II. Background

In cybersecurity, automated systems and programs are commonly used to perform repetitive or large-scale tasks. These systems can be legitimate, but they may also be exploited or controlled by attackers to carry out malicious activities such as spamming, data scraping, or distributed attacks.

III. Tool Used

- **Search Browser -** Used to verify the definition and identify the correct term

IV. Methodology

1. I searched the phrase: *"a group or network of machines that are controlled by an attacker to do certain tasks."*
2. The results pointed to the concept of a **bot**, which refers to an automated program or system.
3. Based on this, I concluded that the correct answer is **Bot**.
4. Submitted the answer.

V. Result

Bot

Answer

Bot

Submit

VI. Explanation

A bot is a software program designed to perform automated tasks. In cybersecurity contexts, bots are often associated with malicious use, especially when multiple infected machines are controlled together as part of a botnet. These bots can be instructed remotely by an attacker to execute coordinated actions without the user's knowledge.

VII. Conclusion

The challenge evaluates understanding of basic cybersecurity terminology. By identifying the definition and verifying it through research, the correct answer was determined. This reinforces the importance of recognizing commonly used terms such as bots in both benign and malicious contexts.
